Student Portal System – Group 13

Course: Back-End Web Development

Assessment Type: Mid-Semester Project

Project Title : Student Portal System

A dynamic web application designed to manage student registration, login, and personalized dashboard access. The system integrates **HTML5, CSS3, and PHP** to demonstrate front-end design, back-end programming, form handling, session management, and file uploads.

Features Implemented

- **Home Page (index.html):** Introduction and navigation bar for easy access.
- **Registration Page (register.php):** Collects student details and allows profile image upload.
- **Login Page (login.php):** Authenticates user credentials with error handling.
- **Dashboard (dashboard.php):** Displays personalized student information and uploaded profile image.
- **Logout (logout.php):** Ends session securely and redirects to home/login.
- **Styling:** Consistent purple–blue theme with centered forms and user-friendly layout.
- **Validation:** Basic input sanitization and error messages for incorrect login or missing fields.

Challenges Encountered

- **Session Persistence:** Ensuring sessions were maintained correctly across pages and destroyed properly at logout.
- **File Upload Handling:** Managing profile image storage in the uploads/ folder and validating file types.

- **CSS Consistency:** Achieving a uniform theme across all pages while keeping forms centered and responsive.
- **Deployment Limitations:** GitHub Pages does not support PHP, so the project can only be run locally on a PHP-enabled server (e.g., XAMPP/WAMP).
